

Complex Geological Conditions in Northshore Lantau

- Key Messages:**
- a) A Designated Area has been established in Northshore Lantau, within which complex geological conditions have been identified.**
 - b) The Geotechnical Engineering Office of the Civil Engineering and Development Department will undertake geotechnical checking of foundation design for both government and private projects within the Designated Area.**

Introduction

This note describes locally complex geological conditions at the reclamation for Tung Chung New Town and along the North Lantau coast (Northshore Lantau).

The identification of these areas of complex geological conditions has led to the establishment of the Designated Area of Northshore Lantau (Figure 1). The Geotechnical Engineering Office (GEO) of the Civil Engineering and Development Department will undertake geotechnical checking of foundation designs within the area.

Geological conditions

The GEO completed in 2002 a series of studies on the geological conditions in the area. The studies identified the geological setting and the nature of the complex geological conditions. The area within which planned developments may be affected by the complex geological conditions is established as the Designated Area of Northshore Lantau (Figure 1).

The area is underlain mainly by medium-grained granite, intruded by numerous rhyolite dykes. These igneous rocks enclose blocks of marble, metasandstone and metasiltstone, ranging from one to more than 300 m across. Blocks of massive marble overlain by superficial deposits are also present in parts of the offshore area. The complex geological conditions comprise one or more of the following interrelated geological phenomena.

- (i) Metasedimentary rocks (including marble, metasandstone and metasiltstone) that are subject to dissolution and give rise to cavities, cavity-fill deposits and residual soils.
- (ii) Superficial deposits (weakly lithified siltstone, or soft or loose alluvial sediment) that occupy depressions, some very deep in the buried top of the weathered rock, and most of which lie directly above or adjacent to metasedimentary rocks.
- (iii) Anomalously deep, or steeply inclined, rockhead.

- (iv) Massive marble, usually with a karstic upper surface displaying solution features, which lies directly below superficial deposits in parts of the offshore area.

These geological conditions could have significant effects on foundation design and construction. They have led in extreme cases in the past to the abandonment of two planned residential tower blocks at the Tung Chung New Town reclamation.

Foundation design

The GEO will undertake geotechnical checking of foundation designs and relevant ground investigation proposals within the Designated Area.

Guidelines and requirements relating to foundation works in the Designated Area are given in GEO Technical Guidance Note No. 12 (TGN 12), GEO Technical Guidance Note No. 26 (TGN 26), and ETWB TCW No. 4/2004.

For developments in the Designated Area where deep foundations are planned, developers, planners and engineers should be aware of the likely presence of marble with cavities and other associated complex geological conditions. They should also be aware of the potential impacts on their developments, in particular on cost, construction programme and the geotechnical input required. Adequate resources, time and technical input should be provided to ensure that deep foundations in the Designated Area are properly designed and constructed.

The following technical documents are available for use by the profession in relation to this subject:

- Hong Kong Geological Survey Sheet Report No. 6 (Sewell & Kirk, 2002), which describes the geology of Tung Chung and Northshore Lantau and includes a “logging guide” to assist in the description of complex core materials.
- The Geology of Tung Chung New Town (Gillespie et al, 1998) which describes in detail the complex geological conditions at Tung Chung.
- Environment, Transport and Works Bureau Technical Circular (Works) No. 4/2004 (ETWB TCW No. 4/2004) which outlines the policy on geotechnical control for foundation works in the Northwest New Territories, Ma On Shan and Northshore Lantau, in respect of government projects undertaken by Works Departments or their consultants.
- GEO Technical Guidance Note No. 12 (TGN 12) which outlines the establishment of the Designated Area of Northshore Lantau.
- GEO Technical Guidance Note No. 26 (TGN 26) which provides supplementary technical guidelines for foundation design in areas underlain by marble and marble-bearing rocks.
- Relevant ground investigation reports (e.g. Lam Geotechnics Limited, 1999) held in the Geotechnical Information Unit (GIU) of the Civil Engineering Library.

Interested parties can arrange to discuss the ground conditions, view reports and obtain data by contacting the Chief Geotechnical Engineer/Planning, GEO.
